A: Go here and search for your product model and file number (found at the top of the page when logged in). If your machine is an All-In-One with Intel Serial Processors, and you don't have a Windows 10 image, you can download the pre-built BIOS files for your machine from here, which contains the correct BIOS for your machine. Once you have the files for your machine, follow the following steps to update your BIOS: Unplug the machine from all power sources Press and hold F1, F2, F5, or Delete when Windows is starting While your machine is booting, press F9 or Delete Press ENTER when Windows starts, then press F10 or Delete Hold the SELECT key when Windows is starting, then press F8 or Delete If you are prompted to select "Ignore any errors and continue", select NO After you have selected NO from the Prompt to update Windows, confirm that the BIOS files are saved to a removable disk or USB drive Open the BIOS by selecting the appropriate option at boot-up, and then press Enter. You must then press Enter at the bottom of the BIOS screen at the bottom right corner. It is currently signed out, so you must enter your BIOS password to sign it in. Once you have signed in, use the "BIOS/Update/Update" function to update your BIOS. From there, click on the icon in the top-right corner of the screen that says "BIOS/Update/Read Found Update" Click "Yes" in the prompt that pops up and the BIOS update should begin. Once the update is finished, verify by going to the Settings menu and selecting "BIOS/Update/Read Found Update" again. Your settings will return to the original settings. You should see "Found update" show up in the list. If you do not, you can select "Do Nothing" and your settings will return to the original settings. Once you have verified that the update worked, reboot the machine. Notes: If you need help finding your product information, please message a moderator or help desk. Dec 21, 2018 Re: Missing PCI Simple Communications Driver. I opened the folder "intel". It is an archive file. Jan 4, 2018 I am working on Windows 10 64 bits desktop. PC with Windows pro installed on it. Device Manager reports errors in "C:\Intel Driver Toolkit\wvd.intel.pcidsmg\Drivers\es_intel_pemcia_c_... I am having the same problems as the guy from the link which is mentioned above. I tried the solution from the link with no luck. I used step by step install file which was mentioned in one of the answers, but it is missing the .inf file for "os_intel_pemcia_c_1.0.8_20171106". The source of the step by step installation file is here: I'm suspecting that the step by step installation file is not working properly. I tried a simple update which is available for Windows 10. When I use the update, it only updates the .msi file (I don't see any .inf file at all). I tried to use the .msi file to install using the command prompt like the step by step installation file. It is not a .exe file. It is .msi file. The installation .msi file didn't install any driver and it gave me this error: If I download the .zip file from the above link, extract and run the "StartupMGR.exe" file, it gives this error: Any suggestions? I followed the steps, even though I didn't think that I used the same version of the driver. Because he wrote that he was able to install a version before that version I tried. I didn't see any .inf file in that folder. So I went to the intel website and downloaded the latest version of the driver and it said that "Available Operating Systems: Windows 10, 8.1, 8, 7, Vista, and XP" (I have Windows 7 pro). I don't have Windows 10. I installed the driver and it f678ea9f9e
